

HTML stands for Hypertext Markup Language and is the standard markup language for documents designed to be displayed in a web browser. It is able to describe the structure and content of a web page semantically and originally included cues for the appearance of the document. HTML elements are the building blocks of HTML documents. With HTML constructs, you can create headings, paragraphs, lists, links, anchors, tables, images, and more. HTML elements are represented by tags, written using angle brackets. For example, `

`: `<html>`: The root element, from which all other elements descend. `<head>`: Defines the metadata for the HTML document. `<body>`
